On Hold · presenter run sheet

Wednesday 28 October 2026 · 10–15 minutes · slides: On-Hold-Presentation.pdf (or the .html: arrows to move, F for full screen)

Timing

WHEN	SLIDES	WHAT TO GET ACROSS
0:00	1–5	R2.4 billion lost to digital banking crime in 2025; scams win in the moment before someone checks. On Hold is for older South Africans and their families: one question, a plain verdict, family told only by consent.
3:00	6 · Live demo	Show, don't tell. Follow the script below; slide 6 is your on-screen checklist.
10:00	7–14	Architecture, the AI as the core feature, the accuracy test, trust and security, CRUD, process, feedback, what's next. About 25 seconds a slide.
13:30	15	Questions. Offer to open the code (see the table on the next page).

Before you present (morning)

1. Fresh demo data, and reset Marie's and Pieter's hourly AI limit: `cd backend` then `uv run python -m scripts.seed`
2. Check the live API: `on-hold-ashen.vercel.app/health` should show `claude-haiku-5-5`.
3. Fill in the peer feedback on slide 13 (three rows), then re-export the PDF.
4. The scam screenshot for demo step 3 is ready: `presentation/demo-scam-sms.png` (a fake SASSA SMS; the live app gives it a Stop).
5. Allow the microphone for onhold.pages.dev and try Speak once.
6. Tabs ready: onhold.pages.dev · the app signed in as admin in a second browser profile · GitHub repo · the demo video (backup).
7. Editor open on `backend/app/ai.py`, `backend/app/main.py`, `backend/scripts/eval.py`, `mobile/src/screens/CheckResult.tsx`.
8. Browser zoom about 125% so the back row can read the phone. Notifications off.

Live demo script (about 7 minutes)

1. **Website** · 30 s
   Open onhold.pages.dev. "This is deployed: the website and app on Cloudflare Pages, the API on Vercel, data on Supabase." Tap **Try the demo** in the phone.

2. **Marie checks a WhatsApp** · 1½ min
   Tap the **Marie** chip → Sign in. Home → **Check something**, paste:

   > **Hi Ma, it's me. My phone fell in the water so this is my new number. Can you send R2,500 for a supplier urgently? I'll pay you back tomorrow. Don't tell Dad.**

   Check it. Point out the breathing pause (on purpose, at least 3 seconds). **Stop** → open **Why we think this** → **Official advice** (a vetted source) → **How this scam takes your money** (the dark "what they're counting on" card) → back → **Tell family**.

3. **A screenshot** · 45 s
   Check → **Screenshot** → pick `presentation/demo-scam-sms.png` → Check it → Stop, citing SASSA.

4. **A call in progress** · 1 min
   Home → **Someone on the phone right now?** → **Speak** and say:

   > **A man says he's from my bank's fraud department and he wants the code they just sent me.**

   Fix any words, Check it → **Say this, then hang up**. (Mic fails? Type it.)

5. **A warning poster** · 30 s
   Check → paste:

   > **WARNING FROM THE RTIA: Beware of fake AARTO traffic fine SMSes offering a discount for paying today. They are scams. Never click links in fine messages.**

   → grey **Scam warning**: "a real warning is never a green tick, and a fake one is a Stop."

6 **Report it, the map, Learn** · 1 min
Home → History → open the Stop from step 2 → **Report it** → submit (“it waits for a moderator”). **Map**: heat by suburb, filter by type. **Learn**: what’s going around, the guides.

7 **Pieter, the guardian** · 30 s
Tap the circle with Marie’s initial (top right of Home) → **Sign out** → **Pieter** chip → **Needs you** shows Marie’s Stop and her Tell-family request.

8 **Admin** · 1½ min
Switch to the admin tab (admin@onhold.test, your private password) → **Admin panel**: **Dashboard** (counts per verdict, the 14-day trend) → **Activity** (Marie’s check and report from a minute ago) → **Reports**: approve Marie’s report, now on the map → **People** → Marie: history, family, activity.

> **If anything fails:** say so calmly, switch to the demo video tab, and carry on from the same step. The API answers in about 3 seconds; a first request after a quiet spell can take 5.

Likely questions, and what to open

QUESTION	SHOW
Where is the AI, and why is it core?	`backend/app/ai.py`: `SYSTEM_PROMPT`, `ScamVerdict`, `run_check`. Every check goes through it; voice goes through Whisper first (`transcribe`).
How do you stop prompt injection?	The `<message>` tags and the rule in `SYSTEM_PROMPT`: an instruction inside a message is itself a scam signal.
How do you know it’s accurate?	`backend/scripts/eval.py`: 29 labelled messages, 29/29 on Sonnet 5 and Haiku 5.5, no dangerous misses. Results in `docs/testing.md`.
Can the AI invent a link?	No: `SOURCES` and `SourceId` in `ai.py`; the schema only allows those 8 ids.
Why Haiku and not a bigger model?	Same score on the test, about 16× cheaper (R0.005 a check), a bit faster. `/health` reports the live model.
How is data secured?	`backend/app/auth.py` (Supabase JWT checked against its keys); queries scoped to the user in `main.py` (e.g. `get_check`); RLS on with no policies in `supabase/migrations`.
Rate limiting and cost?	`_check_rate_limit` in `main.py`: 30 AI calls an hour per person, with an advisory lock. Prompt caching in `run_check`.
How does family consent work?	`create_check` in `main.py`: a Stop alerts only links with `share_verdicts` or `share_calls` on.
Show the CRUD.	Reports and admin routes in `main.py`; all 48 listed in `backend/docs/api.md`.
Deployment?	Vercel: `backend/vercel.json` (Frankfurt) and the transaction pooler (`backend/app/db.py`). Cloudflare Pages: `website/README.md`.
Version control and process?	GitHub network graph: feature → dev → main with merge commits; CI in `.github/workflows/ci.yml`.
What went wrong along the way?	The bug log in `docs/testing.md` (42 entries), e.g. the live API hanging until it moved to the transaction pooler.
